## Terms of Use

**Proprietary Statement** This manual contains proprietary information of Zebra Technologies Corporation and its subsidiaries ("Zebra Technologies"). It is intended solely for the information and use of parties operating and maintaining the equipment described herein. Such proprietary information may not be used, reproduced, or disclosed to any other parties for any other purpose without the express, written permission of Zebra Technologies.

**Product Improvements** Continuous improvement of products is a policy of Zebra Technologies. All specifications and designs are subject to change without notice.

**Liability Disclaimer** Zebra Technologies takes steps to ensure that its published Engineering specifications and manuals are correct; however, errors do occur. Zebra Technologies reserves the right to correct any such errors and disclaims liability resulting therefrom.

**Limitation of Liability** In no event shall Zebra Technologies or anyone else involved in the creation, production, or delivery of the accompanying product (including hardware and software) be liable for any damages whatsoever (including, without limitation, consequential damages including loss of business profits, business interruption, or loss of business information) arising out of the use of, the results of use of, or inability to use such product, even if Zebra Technologies has been advised of the possibility of such damages. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you.

# Printing Preferences

Check the Zebra website for the latest version of this document.

The Printing Preferences Control panel can be used to determine preferences such as which ribbon panels will be used to print images on the card, where the card comes from (i.e., the input hopper or the manual feed slot), and its destination. It is also used to make adjustments to colors and black panel quality; as well as printing test cards, showing configuration information, and connecting to wired or wireless networks.

To open the Printing Preferences Control Panel:

- Windows 7 – Select Start, then click **Devices and Printers**. Right click the Zebra ZCXXX Card Printer, and select **Printing preferences** from the pop-up menu.
- Windows 8 – Press Windows + I and select **Control Panel** from the pop-up menu. Select **Hardware and Sound**, then select **Devices and Printers**. Right click the Zebra ZCXXX Card Printer, and select **Printing preferences** from the pop-up menu.
- Windows 10 – Press Windows + I and select **Devices**, then select **Printers and Scanners**. Select the Zebra ZCXXX Card Printer and click **Manage**, and then select **Printing preferences**.

The tabs listed below make up the menu structure of the Printing Preferences Control Panel:

- Setup
- Encoding
- Help & Support

The utilities listed below complete the menu structure:

- Print Optimization and Adjustment
- Advanced

At the bottom of the control panel window are the following buttons:

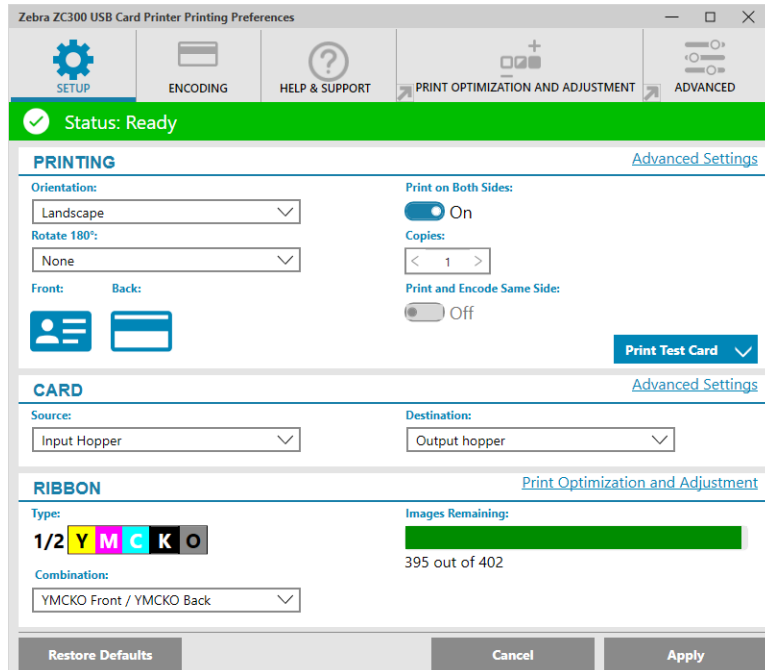

The **Restore Defaults** button sets the printing preferences back to factory settings.

The **Cancel** button closes the Printing Preferences Control Panel without applying the changes made.

The **Apply** button makes (or applies) the changes; the Printing Preferences Control panel remains open.

# Setup Tab

The **Setup** tab enables the user to adjust selected card and print job parameters and print test cards.

## Status Bar

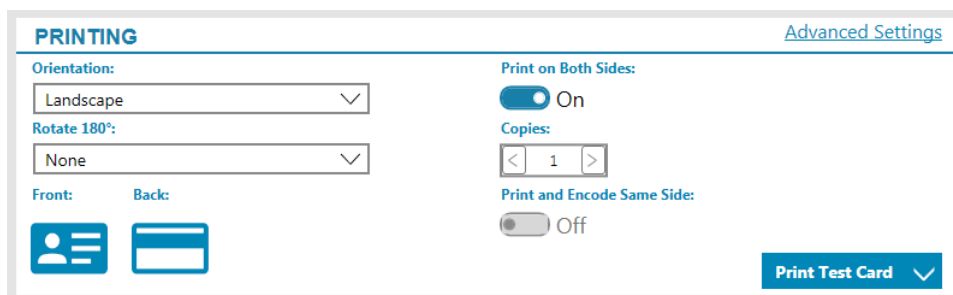

The status bar shows the current state of the printer. When the status bar is green or yellow, you can still print. A red status bar will inhibit printing until the error is corrected.

The **Setup** window is divided into three sections:

- Printing
- Card
- Ribbon

## PRINTING

The **Orientation** drop-down list tells the printer to print in either Landscape (horizontal) or in Portrait (vertical) depending on the design or the desired use of the card. Note that the printing orientation cannot be mixed; in other words, you cannot print portrait on the front and landscape on the back.

The **Rotate 180°** drop-down list tells the printer to rotate the image on the card 180° (degrees). Use this option if you want the images to be oriented the same way depending on how the card is flipped over.

The following selections are available from the Rotate 180° drop-down list:

- None – does not rotate the image(s).
- Front – only rotates the image on the front of the card.
- Back – only rotates the image on the back of the card.
- Both – rotates the image on both the front and the back of the card.

The **Print on both sides** switch enables double-sided printing (applicable to dual-sided printers; ZC100 not compatible).

The **Copies** selection specifies the number of cards to be printed. Click on the up or down arrow to increase or decrease the number.

**Print and Encode Same Side** enables the user to encode a card and print an image on the mag stripe side. This option is disabled when **Print on Both Sides** is enabled. To Print and Encode Same Side the printer must be dual sided, Print on Both Sides must be set to No, and the printer must have a mag encoder.

**Print Test Card** enables the user to print one of two test card types:

The **Graphics Test Card** prints an image appropriate to the current ribbon combination; and if **Print on Both Sides** is selected, a monochrome test image on the back.

Model:	ZC150
Serial Number:	CLJ180400162
Firmware Version:	V201.01.01P6491
PN Serial Number:	7y-60138
PN Resistance:	2804
Network Options:	None
IP Address:	0.0.0.0
DHCP:	Enabled
Mag Encoder:	No
Smart Card Options:	None
Ribbon Detected:	YMCKO
Card Count:	20

The **Configuration Test Card** prints printer configuration information using the K (black) panel on the front only.

## CARD

**CARD**
[Advanced Settings](#)

**Source:**

Manual feed slot
▼

**Destination:**

Output hopper
▼

The **Source** selection lets the user tell the printer where to take the card from. For example, if a single card needs to be printed that is different from the cards in the input hopper, the user can select to manually feed a single card to print on.

The following selections are available in the Card source drop-down list:

- Manual Feed Slot – only takes cards from the manual feed slot.
- Input Hopper – only takes cards from the input hopper.
- Auto Feed (default) – unless a card is fed in from the manual feed slot before the print job is sent, the printer will take the card from the input hopper.
- Already in printer – for third-party applications that use this feature.

The **Destination** selection lets the user tell the printer where to send the finished cards. In some cases, it may be necessary to send the finished card to the reject tray under secure conditions (if the printer lock is installed).

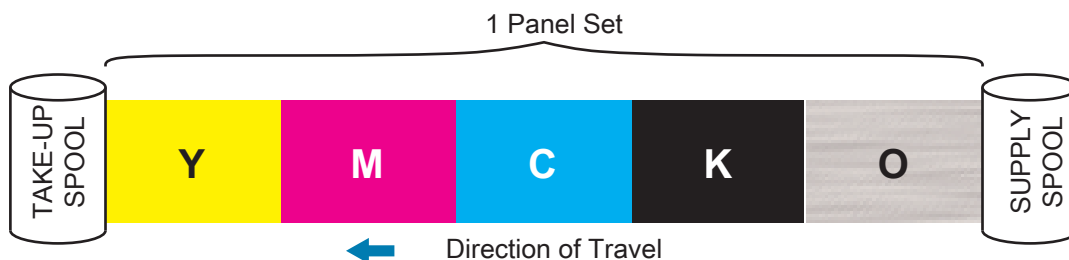

The following selections are available in the Destination drop-down list:

- Output hopper (default) – this sends the finished cards to the output hopper (located under the input hopper).
- Reject bin – this option sends the finished cards to the reject bin which is accessible by opening the print cover (applicable to dual-sided printers; ZC100 not compatible)
- Leave in printer – for third-party applications that use this feature.

## RIBBON

Zebra card printers use ribbons (media) that come in two types: monochrome and color panels. Monochrome ribbons are one continuous ribbon of a single color—typically black, but may be white, gold, or other single color ribbons. With color panels, such as YMCKO (used for full color printing), each individual primary color (yellow, magenta, cyan or YMC) along with black (K) and overlay or varnish (O) are laid out in sequence for one complete card print process.

The printer will recognize the type of print ribbon installed and display it in the **Type** field. The available ribbon combinations will be shown in the **Combinations** drop-down menu. Additionally, the **Print on both sides** and the **Print and Encode on Same Side** settings will affect the available ribbon combinations. The **Images Remaining** status bar indicates how many images can still be printed on the installed ribbon. This feature applies to ribbons with panels and refers to the panel set (YMCK); monochrome ribbons do not apply. When a ribbon cartridge has 10 panel sets remaining, a Ribbon Low warning will be displayed.

The following table shows the supported ribbons and their respective combinations:

Ribbon	Print on Both Sides	Print and Encode Same Side	Ribbon Combination
YMCKO	Off	Off	YMCKO front
		On	YMCKO back
	On	Off	YMCO front / K back (default)
			YMCKO front / YMCKO back
YMCKOK	Off	Off	YMCKO front
		On	YMCKO back
	On	Off	YMCKO front / K back (default)
			YMCKO front / YMCKO back
1/2YMCKO	Off	Off	YMCKO front
		On	YMCKO back
	On	Off	YMCKO front / YMCKO back
1/2YMCKOKO	Off	Off	YMCKO front
		On	YMCKO back
	On	Off	YMCKO front / KO back (default)
			YMCKO front / YMCKO back
KrO	Off	Off	KrO front
		On	KrO back
	On	Off	KrO front / KrO back
KdO	Off	Off	KdO front
		On	KdO back
	On	Off	KdO front / KdO back
K (Monochrome) Includes all single color ribbons	Off	Off	K front
		On	K back
	On	Off	K front / K back
YMCPKO	Off	Off	YMCPKO front
		On	YMCPKO back
	On	Off	YMCPO front / K back (default)
			YMCPKO front / YMCPKO back
YMCKLL	Off	Off	YMCKLL front
		On	YMCKLL back
	On	Off	YMCLL front / K back (default)
			YMCL front / KL back
			YMCKLL front / YMCKLL back
SDYMCKO	Off	Off	SDYMCKO front
		On	SDYMCKO back
	On	Off	SDYMCO front / K back (default)
			SDYMCKO front / SDYMCKO back

The **YMC** panels in a color ribbon are used to create the color image. The ZC100 and ZC300 Series printers use 24 bit color data, color algorithms, and printhead management formulas to achieve 256 shades of color when printing a full color image.

The printer uses the **K** panel to print black elements on a color image (see [“Black Extraction” on page 12](#)), or barcodes and text. This is a resin panel, which means it cannot be used to print continuous tones of color. The K panel can only print binary (pure on or off) images.

K is also used to denote monochrome ribbons, which are available in black, white, gold, silver, red, and blue. Monochrome ribbons are also made of resin materials, which means they cannot be used to print continuous tones of color, and can only print binary (pure on or off) images.

**Kd** denotes a black dye panel, which allows continuous shades of gray to be printed, and is ideally suited for photos and graphics.

The **O** panel is an overlay which protects the dye panels against fading due to the effects of UV light and abrasion. Overlay can also be applied to K resin to further protect text and barcodes against abrasion. This makes the KrO ribbon useful in applications where card is swiped against a magnetic stripe reader and text or barcodes are printed on the opposite side of the magnetic stripe.

The **L** panels in the YMCKLL ribbon enable long lasting color personalization of cards without the use of lamination. The combination of two extra thick overlay panels adds four times more abrasion resistance to a color card, compared to a standard YMCKO ribbon. The panels can also be used to print security features, which will appear as a watermark on the card, and fluoresce under UV light. Refer to [“YMCKLL” on page 20](#) for more information.

The **S** (silver) panel in the SDYMCKO ribbon enables 3D-like visual effects to be created on the card. The Sr is a silver resin panel and it can be printed on the entire card for a metallic effect, or underneath a specific graphic element, like a logo or text and then printed over with YMC to create a unique visual effect. Refer to [“SDYMCKO” on page 21](#) for printing options.

The **P** (pearlescent) panel is a color shifting panel in the YMCPKO ribbon, enabling covert security elements to be printed on the card, on demand. Images printed using the K and the P panels should ideally not overlap in the design of the card. Refer to [“YMCKPO” on page 22](#) for more printing options.

# Encoding Tab

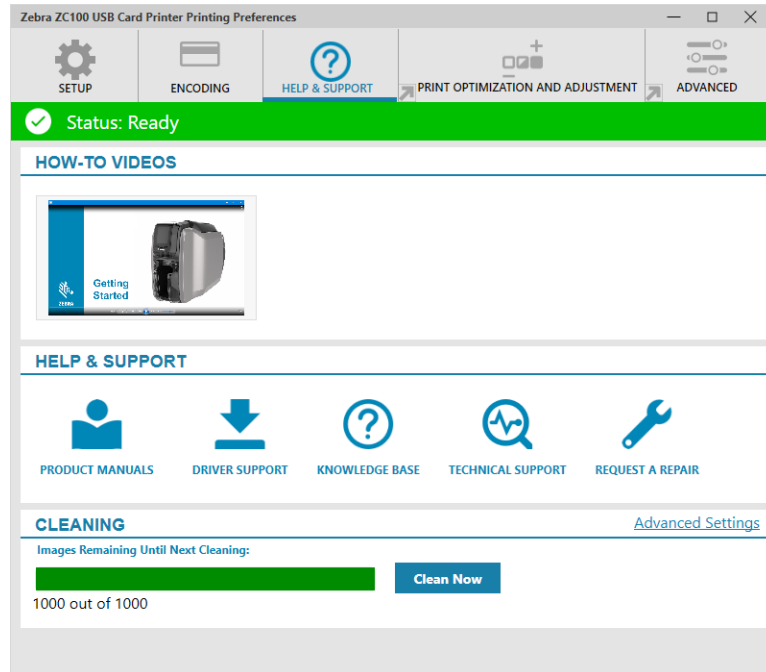

The **Encoding** tab displays the primary magnetic encoding settings, and is only accessible if the magnetic encoding option is installed. To change these settings, or to further customize the magnetic encoding settings, click on **Advanced Settings**.

- **Encoding** – When set to On, a card with a magnetic stripe will be encoded when a print job with magnetic encoding data is sent to the printer. When set to Off, the printer will not encode any cards.
- **Encode Only** – When set to On, only the encoding portion of a print job will be completed. When set to Off, both encoding and printing will be completed.
- **Verification** – When set to On, the printer will verify the data that has been encoded to the card. When set to Off, the printer will not verify the data that has been encoded to the card.
- **Type** – ISO is the standard type of magnetic encoding for most cards. Other formats may be set in Advanced Settings.
- **Coercivity** – The amount of energy required to encode the card. Cards with a magnetic stripe require either High coercivity or Low coercivity.
- **Hex** – The format for the data being encoded to the card. When set to On, the data being encoded to the card will be in hexadecimal format. When set to Off, the data will be in standard ANSI format.

# Help & Support Tab

The Help & Support tab offers users several options to help with the printer, as well as the ability to initiate cleaning.

## HOW-TO VIDEOS

The **How-To-Videos** section offers users videos explaining common tasks and troubleshooting solutions.

## HELP & SUPPORT

The **Help & Support** section offers users links to the different sections of the Product Support page.

Click on the Product Manuals link to download user documentation for your printer.

Click on Product Support to download driver and firmware updates, and other software for your printer.

Click on Knowledge Base to look up specific issues with your printer.

Click on the Technical Support link to contact a representative to assist you with your printer.

Click on Request a Repair if you need expert assistance with a printer issue.

## CLEANING

Caution • **PROTECT YOUR FACTORY WARRANTY!**

The recommended cleaning procedures must be performed to maintain your factory warranty.

NEVER loosen, tighten, adjust, bend, etc., any part or cable inside the printer.

NEVER use a high pressure air compressor to remove particles in the printer.

The regular use of cleaning cards will clean and maintain important parts of your printer that cannot be reached: including the printhead, the transport rollers, and the magnetic encoder station (optional).

The **Cleaning** section shows the user how many cards can be printed before the next cleaning is required. Click **Clean Now** to initiate the cleaning process.

**Step 1.** At the prompt, remove the ribbon and cards from the printer.

**Step 2.** At the prompt, insert the cleaning card into the manual feed slot on the printer.

**Step 3.** The cleaning process will begin.

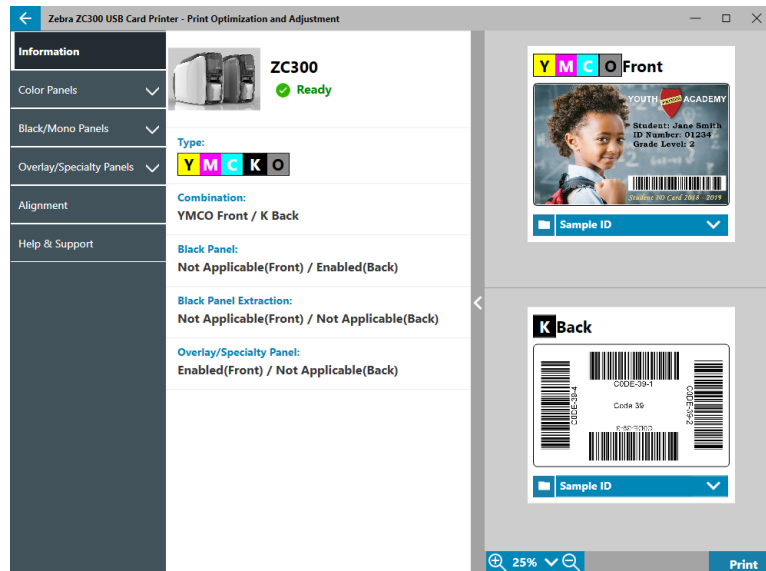

**Step 4.** When the cleaning process has finished, remove the used cleaning card after it has been ejected.

**Step 5.** Replace the ribbon and cards.

# Print Optimization and Adjustment

The Print Optimization and Adjustment utility allows the user to optimize and adjust the printer settings when the default settings do not achieve the desired image quality. Additionally, most settings are shown in a preview window to demonstrate how the settings will affect the card image.

The window options are arranged in tabs as follows:

- Information
- Color Panels
- Black/Mono Panels
- Overlay/Specialty Panels
- Alignment
- Help & Support

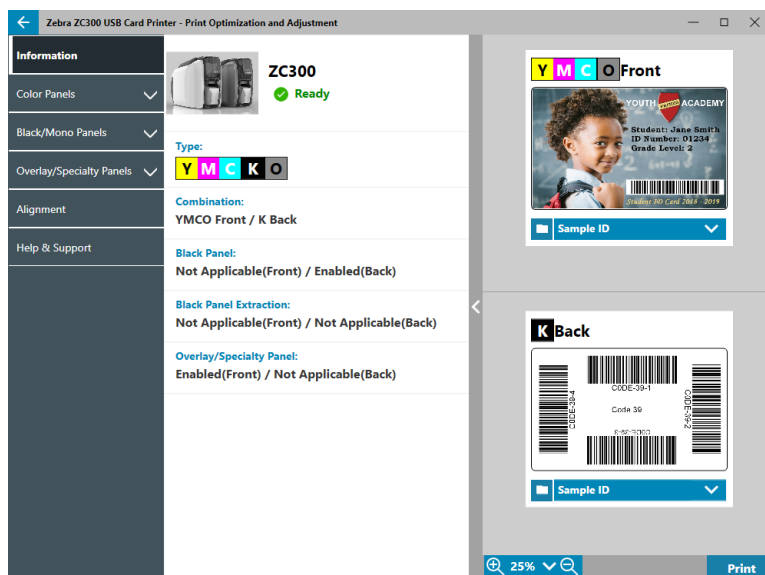

**Note** • The Color Panels, Black/Mono Panels, and Overlay/Specialty Panels tabs are only available when ribbon is installed that has those panels. For example, Black Mono ribbon does not have Color Panels or Overlay/Specialty Panels, so those tabs would not be available.

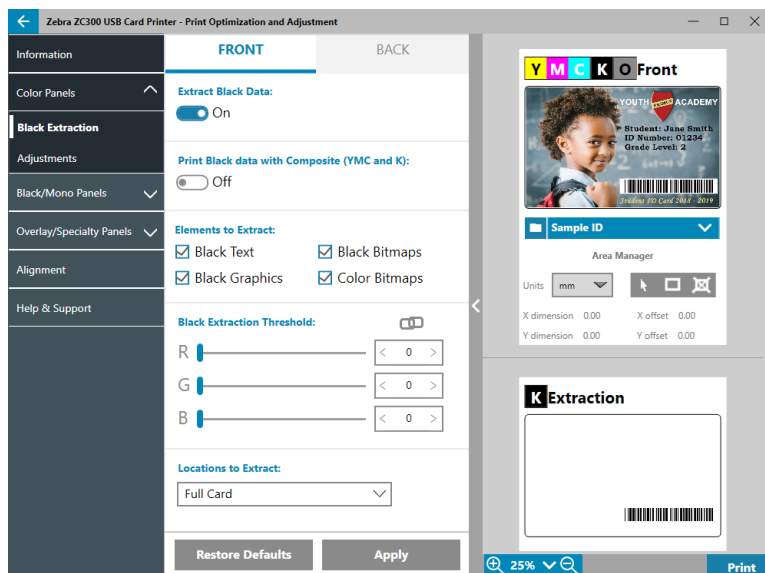

## Information

The **Information** tab displays the current state of the printer (i.e., Ready, Input hopper open, etc.), the Type of ribbon installed (i.e., YMCKO), the ribbon Combination currently selected (i.e., YMCKO front), and the current settings for the Black Panel (Enabled/Disabled/Not Applicable), Black Panel Extraction (Enabled/Disabled/Not Applicable), and Overlay/Specialty Panel (Enabled/Disabled/Not Applicable).

In the card Preview window, you can switch between different sample cards, or you can load your own image. Click on the drop-down list to select the card image to preview, or click  (File Browser), locate the file you wish to upload, and click **Open**. Currently, only BMP images are supported.

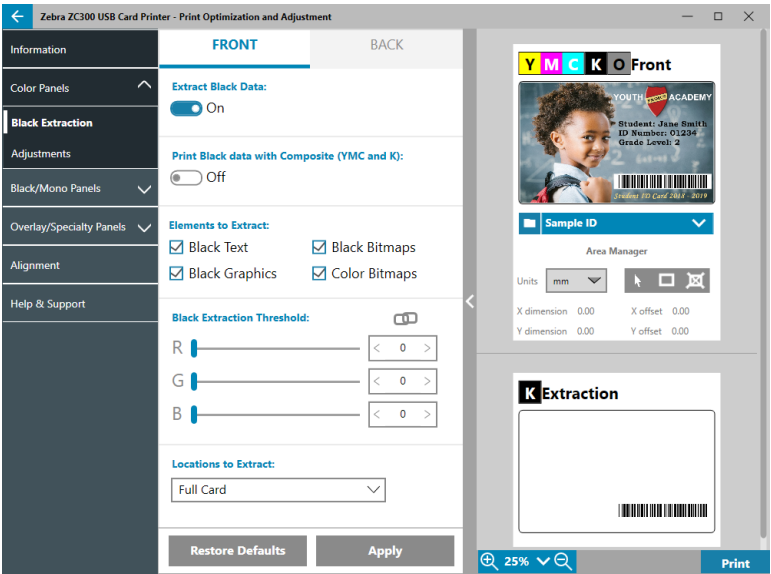

## Color Panels

The **Color Panels** tab contains settings for:

- Black Extraction
- Adjustments
- Half Panel (shown when half-panel ribbon is loaded)

# Black Extraction

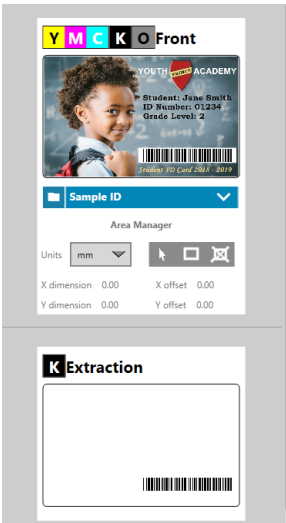

**Note** • The Black Extraction option is only available with color ribbons, when YMC and K panels are on the same side (i.e., YMCKO front).

Black extraction is the process by which the driver examines the color image being used for the print job and divides it up into black elements and color elements. Black elements by default are any pixels that have an RGB code value of (0,0,0). This threshold can be expanded up to (25,25,25) using the Black Extraction Threshold slider.

When black extraction is turned on, the printer uses the K panel to print black elements, rather than using the YMC panels. A preview of the image content that has been identified as black is shown in the Preview pane on the Black Extraction page.

By default, when black extraction is enabled it is applied to the entire card. However, when black extraction is applied to image content (such as portraits or scenic pictures), the user may find that the printed image looks unnatural. In this case, the user can select to apply black extraction to only a portion of the card by using the Locations to Extract option. For example, the user may select to Undefine an area that corresponds to the location of the content that they don't want black extraction applied to.

In the preview, the area to be extracted is highlighted in blue, while the area that should not be extracted is clear.

The discussion above considers the use case of color images; however, some applications, such as Card Studio, allow the user to specifically identify which elements of the image should be printed with the K panel. These elements fall into three categories: Text, Graphics, and Bitmaps. In order for the driver to properly handle this request, these elements need to be checked in the Elements to Extract section.

#### Elements to Extract:

- |  |   |
|--|---|
| <input checked="" type="checkbox"/> Black Text     | <input checked="" type="checkbox"/> Black Bitmaps |
| <input checked="" type="checkbox"/> Black Graphics | <input checked="" type="checkbox"/> Color Bitmaps |

By default, all of these elements are checked. If any of these elements are unchecked, then the driver will not apply black extraction to these elements, regardless of whether the elements are identified by the application to be printed with the K panel.

Lastly, it is sometimes the case that text in an image is anti-aliased, meaning that the central pixels are black while the outer pixels are near-black. While anti-aliasing can make text look smoother, it may look unnatural when the inside of the text is printed with K panel and the outside of the text is printed with YMC panels. To improve this situation, the user may choose to enable the Print Black data with Composite (YMC and K) option.

#### Print Black data with Composite (YMC and K):

☐ Off

When this feature is enabled, the black elements of the image are printed with both YMC panels and K panels. This makes for a smoother transition between black and near-black content. While this option may work well for text or other anti-aliased content, it is not recommended for use with barcodes, as they are not anti-aliased and any misregistration between the YMC and K panels will degrade the scannability of the barcode.

## Using the Area Manager

The Extraction Area tools enable the user to selectively define an area to which black extraction is applied. These tools are only available when **Locations to Extract** is set to **Defined Areas** or **Undefined Areas**.

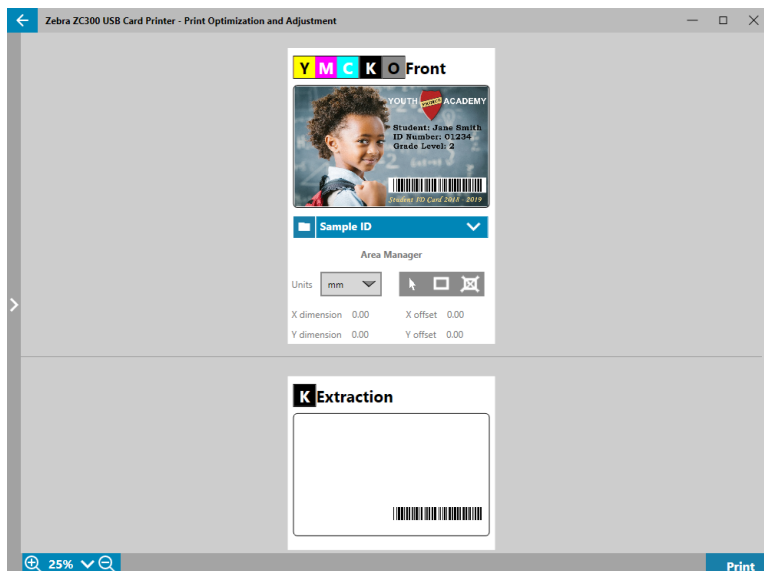

Defined areas applies black extraction to areas of the image inside of the zones specified in the Area manager, Undefined areas applies black extraction to areas of the image outside of the zones specified in the Area manager.

To create a zone, select the rectangle icon , click an area of the image to establish the first corner of the zone, drag the cursor until the zone is the desired size and shape, then release the mouse button. Note that multiple zones can be defined.

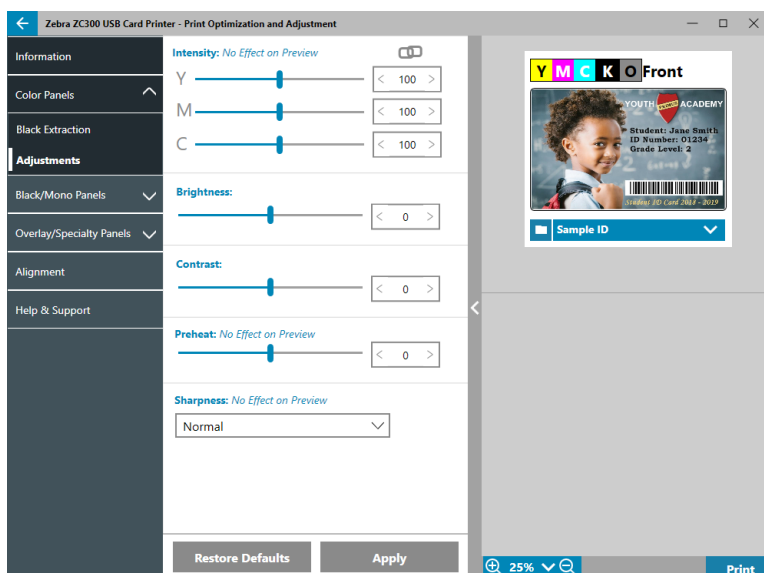

To select, move, or resize a zone, select the arrow icon , click a zone to select it, then drag it to move it, or drag on the edges to resize it.

To delete a zone, select the rectangle icon with an "X" through it , then click the zone that you want to delete.

If larger preview image is needed to work with, click on the preview utility (<). This enables the use of the full window to create the extraction area. Click on  25%  (zoom tools) to enlarge the image.

## Adjustments

The **Intensity** adjustments gives the user control over how much of each color is applied to the card. For example: If the user feels that more yellow should be applied, the Y slider can be adjusted higher, this applies to the M and C sliders also. Additionally, the sliders can be adjusted simultaneously by clicking the  (Link) button.

**Brightness** adjustment boosts or reduces the mid-tones in an image, which makes an image appear brighter or darker.

**Contrast** refers to the range of tonal values in an image. High contrast increases the range of light to dark, while low contrast reduces the range.

The **Preheat** controls the preheating of the printhead. During printing, the individual pixels go from a “rest” temperature to “printing” temperature very quickly, however for thin lines the pixels may not be able to reach the activation temperature of the ribbon before returning back to the rest temperature. Increasing the preheat may make it easier for the pixels to reach the activation temperature, resulting in a darker or more complete line being printed.

The **Sharpness** adjustment changes the visual perception of the clarity and resolution of an image.

- None – does not apply any sharpening to the image.
- Low – applies some sharpening to the image.
- Normal – (default) applies a degree of sharpening that, while noticeable, is not unsightly.
- High – applies a degree of sharpening that is noticeable and may seem unsightly. This can also be a purposeful effect.

## Half Panel

The **Half-Panel** ribbons are used for printing full color images on a smaller area of a card (i.e., an ID photo). The color panels are half the size of a normal color panel so waste is reduced and cards printed per ribbon is greater; the K (black) and Overlay panels remain full size.

**Note** • The printable area for the color portion of the half-panel ribbon is 34 millimeters wide.

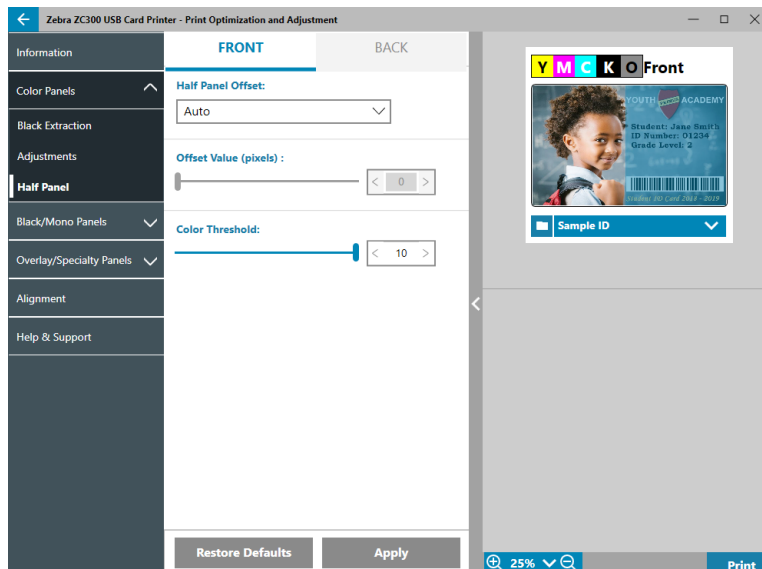

Typical YMCKO Ribbon

Half Panel YMCKO Ribbon

The Print Settings and Adjustments remain the same, with the exception of the Half Panel Options.

The **Half Panel Offset** has four settings:

- Auto (default) – detects the location of the color portion of the image and starts color printing at that location. In some cases, Auto detect may not be suitable for your image. In such cases, the other three options may work better.

The **Color Threshold** slider is used to adjust the sensitivity of the algorithm that determines the starting location of the color panels. It is only available with the Auto offset.

- Custom – enables a manual offset setting.

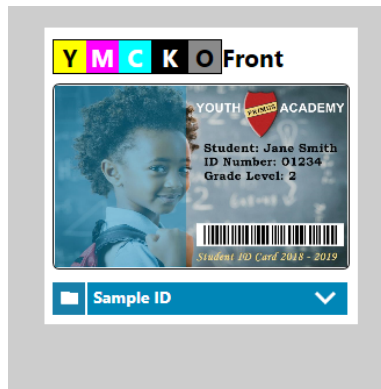

The **Offset Value** slider is only available with the Custom offset.

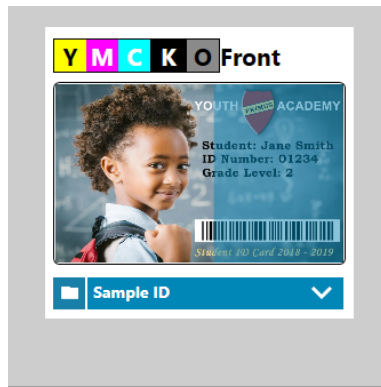

**Note** • Measurements are in pixels and start at the left, 1 pixel = 0.085 mm.

- Left Side – sets the print area to the left side of the card.

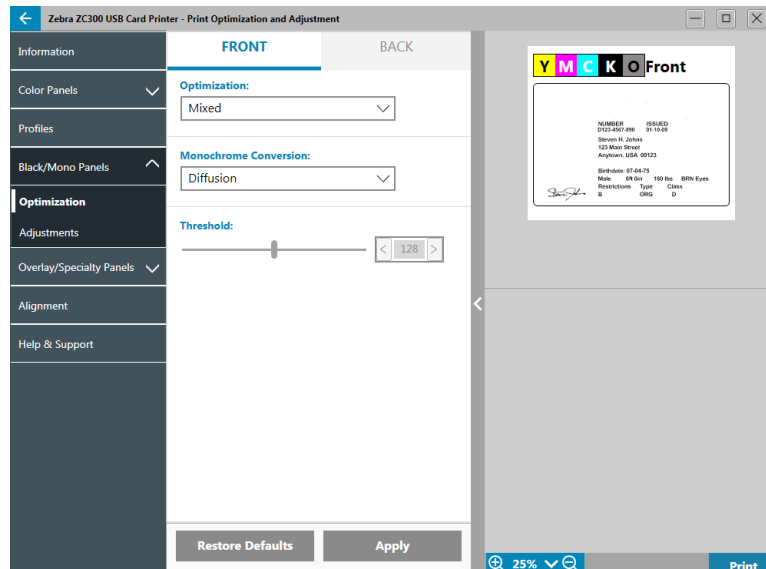

- Right Side – sets the print area to the right side of the card.

## Black / Mono Panels

The Black/Mono Panels tab displays available options to optimize black panel printing for the type of image being printed.

The available options for the Front and Back are the same and can be set independently.

**Tip** • The selection that most closely matches the type of image you are trying to optimize for may not be the best selection. If the selection does not produce the desired results, experiment with the other selections.

## Optimization

**Optimization** enables presets for optimal printing:

- **Mixed** will optimize black panel printing for both text and barcodes, or text and pictures, or other combinations.
- **Barcode** optimizes black panel printing for sharp barcodes that are easily read by scanners.
- **Text** optimizes black panel printing to produce crisp, clear text.

**Monochrome Conversion** is used to convert continuous tone 8-bit-per-pixel RGB or gray image content into binary 1-bit-per-pixel content, as monochrome panels can only print binary (pure on or off) images.

**Threshold** – This is the simplest method for converting from 8 bits per pixel to 1 bit per pixel. For example, the input pixel can be a value from 0 to 255. If the threshold is 128, any pixel from 0 to 128 becomes full on (1); and any pixel that is higher than 128 becomes full off (0). This mode works best for text, barcodes, line art, logos -- everything except continuous-tone pictures. Use the Threshold slider to set the desired value.

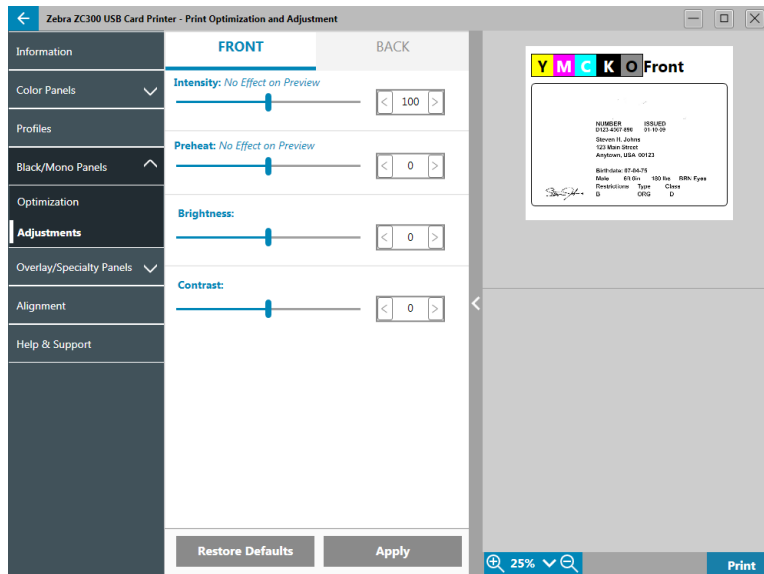

**Diffusion** – Dither diffusion is used primarily where you have a full color (RGB image with 8 bits per pixel) or full gray (single color but still 8 bits per pixel) that you need to print with binary printing (can only print full-on or full-off; i.e., 1 bit per pixel). Typically preferred over halftoning for most images. Use the brightness and contrast sliders to adjust the levels to the desired output.

**Halftone** – prints the bitmap image as a 6 x 6 halftone image, which simulates continuous tone imagery through the use of dots, varying either in size or in spacing.

# Adjustments

The **Intensity** adjustments gives the user control over how dark or light the black/mono panel is printed.

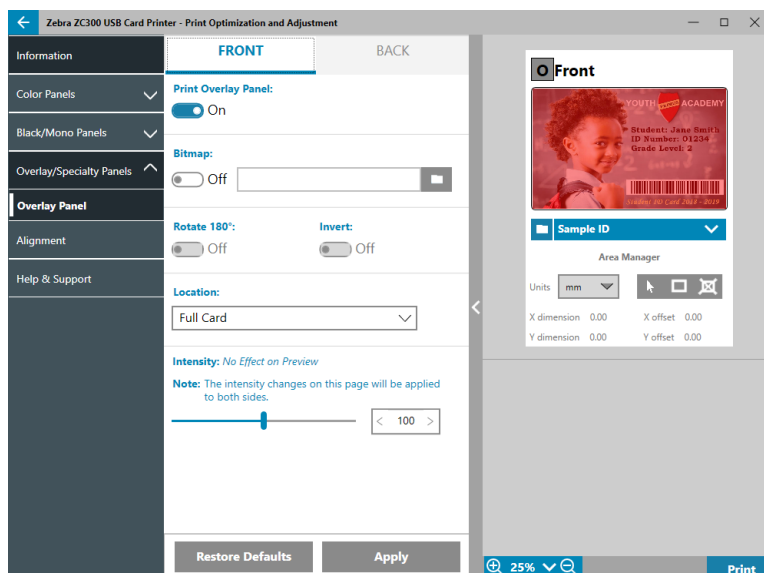

**Brightness** adjustment boosts or reduces the mid-tones in an image, which makes an image appear brighter or darker.

**Contrast** refers to the range of tonal values in an image. High contrast increases the range of light to dark, while low contrast reduces the range.

The **Preheat** controls the preheating of the printhead. During printing, the individual pixels go from a “rest” temperature to “printing” temperature very quickly, however for thin lines the pixels may not be able to reach the activation temperature of the ribbon before returning back to the rest temperature. Increasing the preheat may make it easier for the pixels to reach the activation temperature, resulting in a darker or more complete line being printed.

## Overlay/Specialty Panels

The Overlay/Specialty Panels tab offers the user adjustments to the overlay panel; and, if equipped, adjustments to the specialty panel (such as the L or Silver panel).

The Overlay Panel options are as follows:

**Print Overlay Panel** On/Off determines if the panel is used. If the selections is set to On, the overlay panel is used and the remaining options are available; if the selection is set to Off, printing of the overlay panel is skipped.

**Bitmap** On/Off tells the printer to print a solid image using the Overlay panel, such as a logo, a shape, or text that has been converted to a 1-bit per pixel bitmap. Set Bitmap to Off if no image is to be used. If Bitmap is set to On, click  (File Browser), locate the file you wish to upload, and click **Open**. Only 1-bit BMP and JPG files are supported.

**Rotate 180°** is enabled when Bitmap is set to On, or when Bitmap is set to Off and the Location is set to any selection other than Full Card

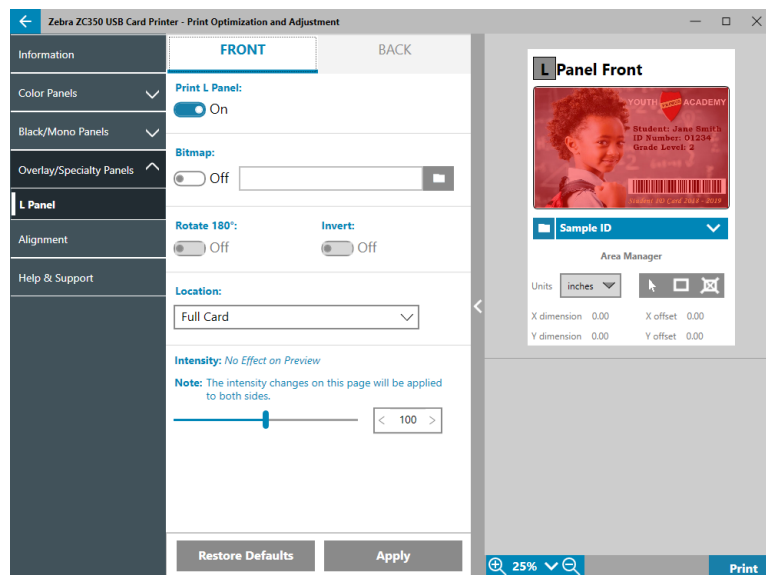

**Invert** is enabled when Bitmap is set to On, and reverses the dark and light colors--creating a negative image.

The Location option enables the user to define areas of the card for which to apply the overlay. The choices are:

- Full card applies the overlay to the entire printed area.
- Defined Areas – applies the overlay to areas of the image inside of the zones specified in the Area manager (see [“Using the Area Manager” on page 13](#)).
- UnDefined Areas – applies black extraction to areas of the image outside of the zones specified in the Area manager (see [“Using the Area Manager” on page 13](#)).
- Smartcard – This option leaves a small area open over a smartcard chip.
- Magnetic Stripe – This option leaves an area open over the magnetic stripe.

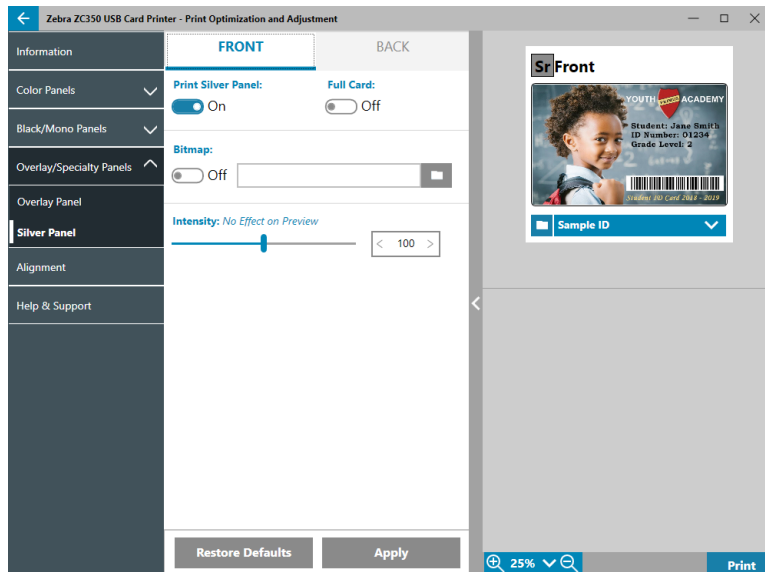

The **Intensity** adjustments gives the user control over how dark or light the overlay panel is printed.

## YMCKLL

The options for the L panel are the same as for the Overlay panel. When both L panels are printed on the same side of the card, and the bitmap option is enabled, the bitmap is only printed using one of the L panels. This allows security features to be printed while maintaining a protective overlay.

There are three option combinations for printing with the Silver (S) panel:

1. **Print Silver Panel: On**

**Full Card: Off**

**Bitmap: Off**

This combination enables the user to print a unique silver panel image for each card.

This combination requires the user to send two images to the printer in order to print with the silver panel. The first image is for the silver panel, while the second image is for the color panels. If K is also on the same side (i.e., SDYMCKO front), then K will be extracted from the second image if this feature is enabled. If K is on the back side of the card (i.e., SDYMCO front / K back), then a third image is needed for the K panel—the first image is still for the silver panel and the second image is still for the color panels. When printing SDYMCKO front / SDYMCKO back, four images need to be sent to the printer. The first image is for the silver panel on the front, the second image is for the color and K panels on the front, the third image is for the silver panel on the back, and the fourth image is for the color and K panels on the back.

2. **Print Silver Panel: On**

**Full Card: On**

**Bitmap: Off**

This combination enables the user to give the entire card a shiny look. Note that non-printed areas will appear silver, so this combination is best suited for color images that completely cover the entire card.

This combination fills the entire card with the silver panel. The user only needs to send one color image to the printer for single sided cards (i.e., SDYMCKO front), or two images to the printer for dual-sided jobs (i.e., SDYMCO front / K back (first image color, second image mono) or SDYMCKO front / SDYMCKO back (both images color)).

3. **Print Silver Panel: On**

**Full Card: Off**

**Bitmap: On**

This combination enables the user to print the same image with the silver panel for every card, such as for a logo or graphic.

This combination uses the same user-supplied bitmap for the silver panel for every card. Once the bitmap has been selected, the user only needs to send one color image to the printer for single sided cards (i.e., SDYMCKO front), or two images to the printer for dual sided jobs (i.e., SDYMCO front / K back (first image color, second image mono) or SDYMCKO front / SDYMCKO back (both images color)).

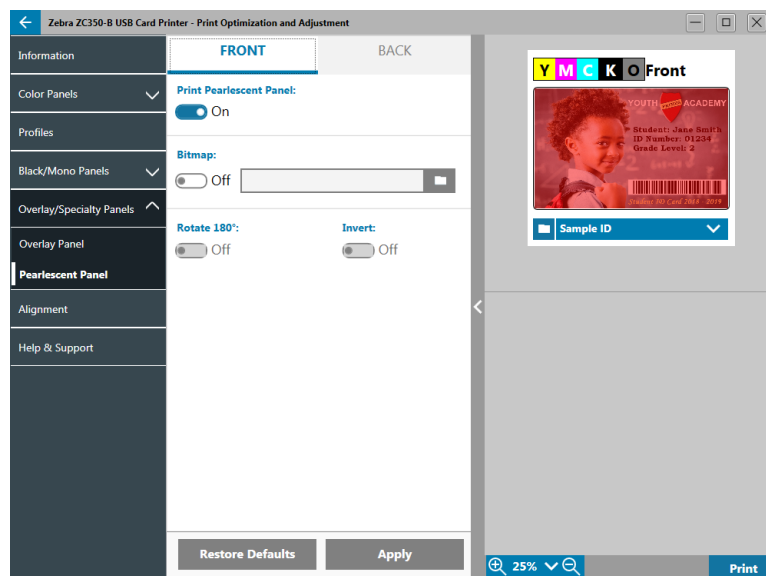

Note that the front and back silver panel options can be set independently; however, this only applies to the SDYMCKO front / SDYMCKO back ribbon combination. The number and type of images required for each side are as specified above for single-sided cards.

#### 4. **Print Silver Panel: Off**

Silver panel is not printed.

Lastly, the Intensity slider can be used to increase or decrease the intensity of the silver panel. In most cases this should not be necessary; however, some card types may require more or less energy to print successfully with the silver panel.

## YMCKPO

There are two option combinations for printing the Pearlescent (P) panel.

#### 1. **Print Pearlescent Panel: On**

**Bitmap: Off**

This combination enables the user to print a unique pearlescent panel image for each card.

This combination requires the user to send two images to the printer in order to print with the pearlescent panel. The first image is for the color panels, and the second image is for the pearlescent panel. If K is also on the same side (i.e., YMCPKO front), then K will be extracted from the first image if this feature is enabled. If K is on the back side of the card (i.e., YMCPO front / K back), then a third image needs to be sent to the printer for the K panel. The first image is still for the color panels and the second image is still for the pearlescent panel. When printing YMCPKO front / YMCPKO back, four images need to be sent to the printer. The first image is for the color and K panels on the front, the second image is for the pearlescent on the front, the third image is for the color and K panels on the back, and the fourth image is for the pearlescent panel on the back.

#### 2. **Print Pearlescent Panel: On**

**Bitmap: On**

This combination enables the user to print the same image with the pearlescent panel for every card, such as a logo or graphic.

This combination uses the same user-supplied bitmap for the pearlescent panel for every card. Once the bitmap has been selected, the user only needs to send one color image to the printer for single sided cards (i.e., YMCPKO front), or two images to the printer for dual sided jobs (i.e., YMCPKO front / K back (first image color, second image mono) or YMCPKO front / YMCPKO back (both images color)).

When the Bitmap option is used, the user has the added flexibility to rotate the bitmap and/or to invert the bitmap. The rotate option rotates the image 180 degrees. The invert option turns all active (black) content inactive (white), and vice versa. These options can be used independently or together.

Note that the front and back pearlescent panel options can be set independently; however, this only applies to the YMCPKO front / YMCPKO back ribbon combination. The number and type of images required for each side are as specified above for single sided cards.

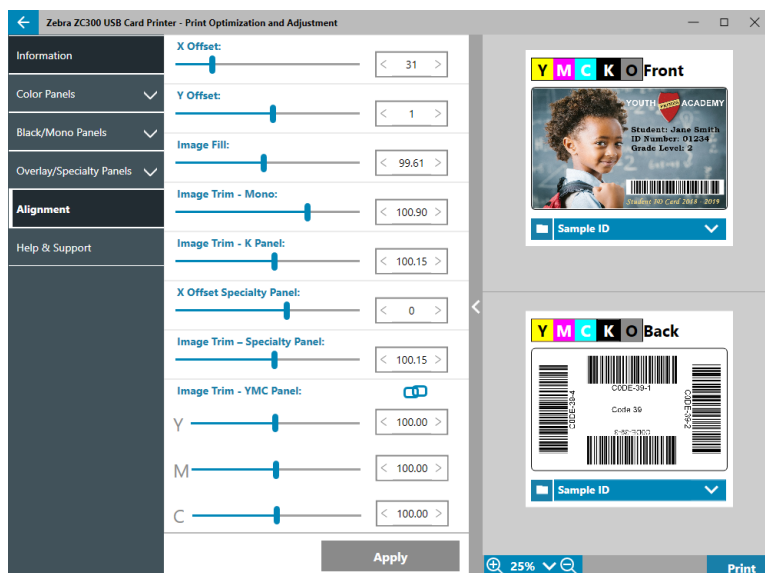

### 3. Print Pearlescent Panel: Off

Pearlescent panel is not printed.

Lastly, the Intensity slider can be used to increase or decrease the intensity of the pearlescent panel. In most cases this should not be necessary, however some card types may require more or less energy to print on successfully with the pearlescent panel.

## Alignment

The Alignment tab enables the user to make corrections to printing if the image is off center, or the panels are misaligned with each other.

X Offset – The X Offset setting adjusts the placement of the image along the long axis.

**Y Offset** – The Y Offset setting adjusts the placement of the image along the short axis.

**Image Fill** changes the length of the printed image.

**Image Trim - Mono** changes the length of the printed image when monochrome ribbon is used.

**Image Trim - K Panel** changes the length of the part of the image printed with the K panel.

**X Offset Specialty Panel** adjusts the placement of the specialty panel image along the long axis.

**Image Trim - Specialty Panel** changes the length of the part of the image printed with the specialty panel.

**Image Trim - YMC Panel** changes the length of the individual Y, M, and C panels independently. Additionally, the sliders can be adjusted simultaneously by clicking the  (Link) button

## Help & Support

See [“Help & Support Tab”](#) on page 8.

# Advanced Settings

The Advanced Settings window is a separate utility that enables adjustments and configuration of the printer. The window options are contained in the following tabs:

- Information
- Connectivity
- Magnetic Encoding
- Configuration
- Security
- Sensors and Calibration
- Advanced Features
- Help & Support

## Information

The **Information** tab shows the current state of the printer, the current version of the driver, the serial number of the printer, the current installed firmware version, the interface type, and the total number of cards printed.

The **Friendly Name** of the printer is a user-created name to identify the printer on the network.

The **Ribbon** section of the Information tab show the current ribbon type installed in the printer, the selected panel combination, and the number of images remaining on the current ribbon cartridge.

The **Options** section of the Information tab shows the available options and their respective installed status.

## Connectivity

The **Connectivity** tab enables the user to configure the respective network options, either wired (Ethernet) or wireless (Wi-Fi).

The screenshot shows the 'Wired Ethernet' configuration page. The left sidebar contains a menu with 'Connectivity' selected. The main area displays the 'Wired Ethernet' status as 'Connected' with a green checkmark. Below this, the 'SETTINGS' section includes toggle switches for 'Use DHCP' (On) and 'Use SNMP' (On). To the right, there are input fields for 'IP Address' (10.1.24.21), 'Subnet Address' (255.255.255.0), and 'Gateway' (10.1.24.1). At the top right, the 'IP Address' and 'MAC Address' (00:07:4d:7c:a1:2b) are displayed. At the bottom, there are 'Restore Defaults', 'Cancel', and 'Apply' buttons.

This options is primarily used to set a static IP address.

Turn DHCP off to set a static IP address.

Turn SNMP off if you do not want the printer to be discoverable on the network.

You cannot configure the settings for Wired Ethernet while you are connected via Ethernet; Ethernet settings are configured while the printer is connected via USB. This is to prevent loss of communication.

## Magnetic Encoding

The **Magnetic Encoding** tab enables the user to configure settings for magnetic encoding, and to encode and read cards equipped with a magnetic stripe.

The screenshot shows the 'Magnetic Encoding' configuration page. The left sidebar has 'Magnetic Encoding' selected. The main area displays the 'SETTINGS' section with toggle switches for 'Magnetic Encoding' (On), 'Encode Only' (On), and 'Verification' (On). To the right, there are dropdown menus for 'Type' (CUSTOM), 'Coercivity' (Low), and a toggle for 'Hex Encoding' (Off). Below these, there are three tabs: 'TRACK 1', 'TRACK 2', and 'TRACK 3'. The 'TRACK 3' tab is active, showing settings for 'Type' (CUSTOM), 'Bit Density (bpi)' (210), 'Character Size' (5), 'LRC Parity' (Odd), 'Start Sentinel' (.), 'Start Sentinel Offset' (0), and 'End Sentinel' (?). At the bottom, there are 'Restore Defaults', 'Cancel', and 'Apply' buttons.

## Settings

Switch **Magnetic Encoding** to On to enable magnetic encoding.

Switch **Encode Only** to On to bypass any printing to the card.

Switch **Verification** to On (default) to enable the printer to verify the encoding process was successful.

Select the **Type** of encoding to perform:

- **ISO** – standard format for magnetic encoding.
- **AAMVA** – American Association of Motor Vehicle Administrators (AAMVA). AAMVA modifies the ISO standard by allowing 79 alphanumeric data characters on track 1 (plus SS, ES, and LRC), 37 numeric data characters on track 2 (plus SS, ES, and LRC), and 79 alphanumeric data characters on track 3 (plus SS, ES, and LRC). Bit density is the same as ISO, however track 3 has 7 bits per character (because it is alphanumeric).
- **BINARY** – When BINARY is selected, the user can modify the Bit Density on each track. The ISO format specifies a bit density of 210 bpi for tracks 1 and 3 and 75 bpi for track 2. With BINARY selected, the user can choose between 75 bpi or 210 bpi for each track.
- **CUSTOM** – When CUSTOM is selected, the user can not only modify the bit density on each track, but they can also modify the character size (between 3 and 7 bits per character) and the LRC Parity (ISO standard is Odd, CUSTOM also allows Even).

BINARY and CUSTOM are custom modifications to the ISO format. Cards encoded with BINARY or CUSTOM formats typically will not work in standard magnetic stripe readers, and should therefore be reserved for specific applications.

Switch **Hex Encoding** to On to use hexadecimal format for encoded data.

**Track 1** allows up to 76 alphanumeric data characters (plus start sentinel, end sentinel, and longitudinal redundancy check (LRC) character). Bit density is 210 bpi (bits per inch) and there are 7 bits per character (derived from ASCII). Bit density is how tightly the data bits (1's and 0's) are spaced together on the magnetic stripe.

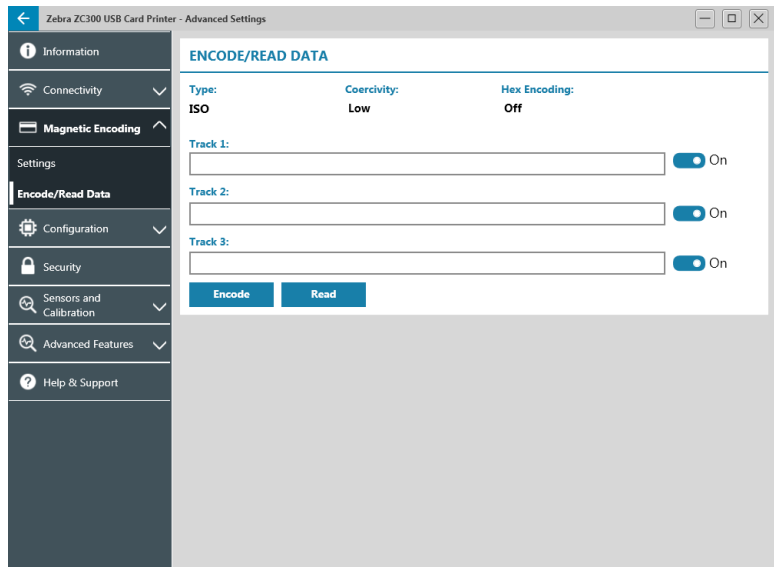

**Track 2** allows up to 34 numeric data characters (plus SS, ES, and LRC). Bit density is 75 bpi and there are 5 bits per character.

**Track 3** allows up to 104 numeric data characters (plus SS, ES, and LRC). Bit density is 210 bpi and there are 5 bits per character.

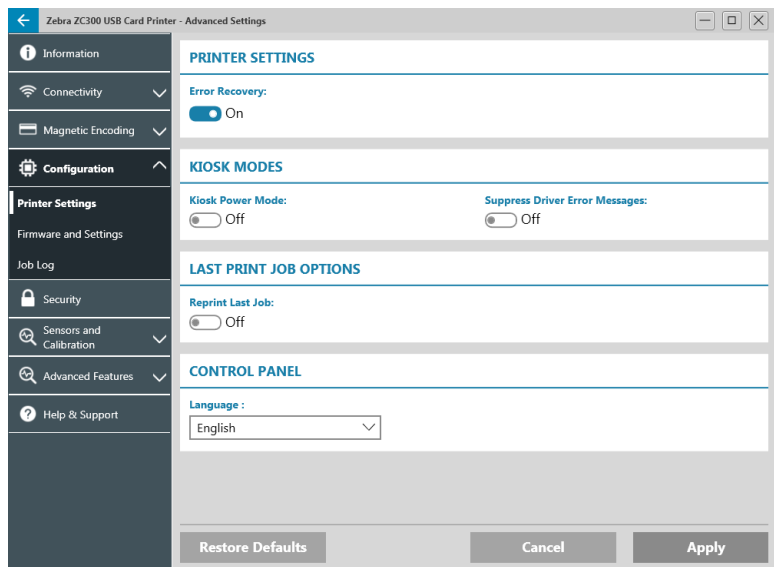

## Encode/Read Data

The **Encode/Read Data** section is used to verify the settings.

## Configuration

The **Configuration** tab is divided into three sub-tabs:

- Printer Settings
- Firmware and Settings
- Job Log

### Printer Settings

The **Printer Settings** sub-tab is divided into four sections:

In the **Printer Settings** section, the user can turn Error Recovery on or off.

In the **Kiosk Modes** section, the user can enable Kiosk Power Mode, and enable Suppress Driver Error Messages. With Kiosk Power mode set to On, the printer will power up as soon as power is applied; with Kiosk Power Mode set to Off (default), the user must press the power button at the front of the printer to power up the printer.

The screenshot shows a settings window titled "KIOSK MODES". It contains two toggle switches. The first is labeled "Kiosk Power Mode:" and is currently set to "Off". The second is labeled "Suppress Driver Error Messages:" and is also set to "Off".

The **Last Print Job Options** section is where the user can choose to reprint the last job from the Operator Control Panel (OCP).

The screenshot shows a settings window titled "LAST PRINT JOB OPTIONS". It contains a single toggle switch labeled "Reprint Last Job:" which is currently set to "Off".

In the **Control Panel** section, the user can change the language of the control panel. The available choices are English, French, Italian, Spanish, Portuguese, German, Polish, Russian, Chinese, and Arabic.

The screenshot shows a settings window titled "CONTROL PANEL". It contains a dropdown menu labeled "Language :" with "English" selected.

## Firmware and Settings

The **Firmware and Settings** sub-tab is divided into two sections:

The screenshot shows the "Zebra ZC300 USB Card Printer - Advanced Settings" window. On the left is a sidebar with navigation options: Information, Connectivity, Magnetic Encoding, Configuration (selected), Printer Settings, Firmware and Settings (selected), Job Log, Security, Sensors and Calibration, Advanced Features, and Help & Support. The main content area is divided into two sections. The top section, titled "FIRMWARE", shows the "Current Version" as "V201.01.01P6172" and a "Firmware Source" field with an "Update" button. The bottom section, titled "SAVE/RESTORE SETTINGS", shows the "Default Folder" as "C:\ProgramData\ZC Printer Drivers\Config\" and includes "Printer Settings" and "Driver Settings" sections, each with "Save" and "Restore" buttons. Below these is a large empty box labeled "Saved/Restored Settings".

In the **Firmware** section, the user is shown the current firmware version, and can update to the latest firmware.

Click  (File Browser), locate the file you wish to upload, and click **Open**. Then click **Update**.

**FIRMWARE**

Current Version:  
**V201.01.01P6172**

Firmware Source:

 **Update**

A dialog box with several cautionary statements will be displayed, confirm you understand the risk by clicking **OK**.

**Zebra ZC300 USB Card Printer** ✕

You are about to erase and reprogram the printer firmware. If you choose the wrong file, the printer will no longer function. You will then need to return the printer to Zebra to get your printer functional again. If the line voltage to the printer fails during programming, the printer will no longer function. You will then need to return the printer to Zebra to get your printer functional again. If your line voltage is questionable, put your printer on a UPS before proceeding. If you are not sure how to proceed, click on the CANCEL button and call Zebra for help. Once you have selected the correct file and sent it to the printer, the printer will start upgrading the firmware. Once the upgrade is completed, the printer will restart. The upgrade process may take a minute or more.

**OK** **Cancel**

The firmware is sent to the printer. The printer status will be displayed in the status banner at the top of the Setup tab; or, if equipped, the printer LCD screen. Click **OK**.

**Zebra ZC300 USB Card Printer** ✕

 The firmware file has been sent to the printer. DO NOT SWITCH PRINTER POWER OFF DURING THE UPGRADE. After the firmware upgrade is complete, the printer will restart. In some cases, this may take a minute or more.

**OK**

**WARNING** • Do not turn off printer power during firmware upgrade or serious damage to the printer may occur. The printer will automatically reboot at the end of the upgrade process.

In the **Save/Restore Settings** section, the user can save or restore previously saved settings for the Printer and The Driver.

**SAVE/RESTORE SETTINGS**

Default Folder:  
**C:\ProgramData\ZC Printer Drivers\Config\**

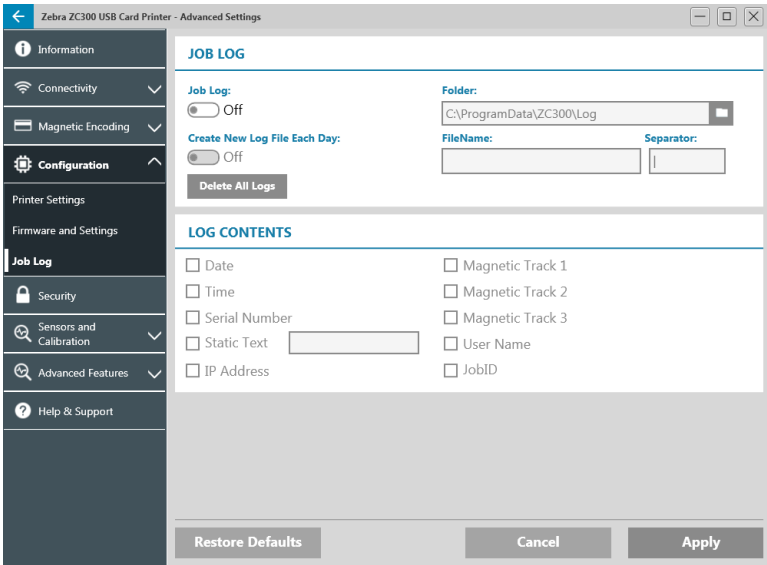

Printer Settings: **Save** **Restore**

Driver Settings: **Save** **Restore**

Saved/Restored Settings:

# Job Log

The **Job Log** sub-tab is divided into two sections:

The **Job Log** section is where the user can turn the job log on or off. With Job Log turned on, select a location to store the Job Log by clicking  (File Browser), locate the folder you wish to store the log in and click **OK**. Enable Create New Log File Each Day to create a new log file each day; when enabled, the user can create a unique file name and a separator to differentiate each day's log. Click **Delete All Logs** to clear all logs from the local computer or network.

With Job Log turned on, the user can select what information gets stored in the log under the **Log Contents** subsection.

# Security

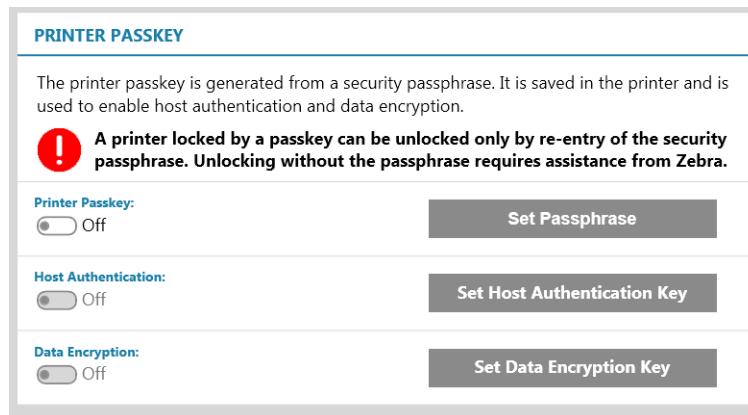

The **Security** tab is divided into two sections:

In the **Security Settings** section, the user can set Erase Job Data After Sending On or Off. This will prevent the last print job from being recovered.

In the **Printer Passkey** sections, the user can enable the following options:

Setting **Printer Passkey** to **On** will enable the user to set a master passkey to be able to access the control panel features.

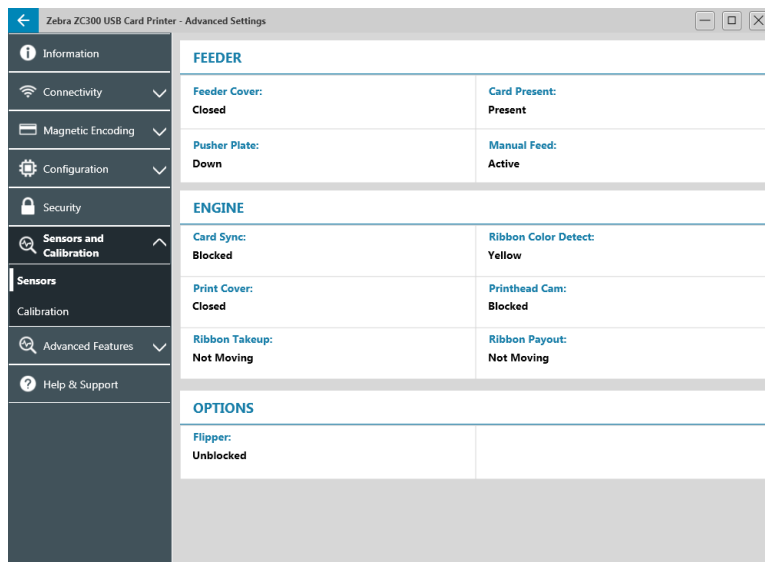

**Important** • The Printer Passkey is not recoverable. Make sure when setting a printer passkey that is is remembered or written down in a secure location.

Setting **Host Authentication** to **On** enables the printer to verify that the computer sending the print job is authorized to do so.

Setting **Data Encryption** to **On** will encrypt the data being sent to the printer so that if it's intercepted it will not be readable.

# Sensors and Calibration

The **Sensors and Calibration** tab is divided into two sub-tabs:

- Sensors
- Calibration

## Sensors

The **Sensors** sub-tab is divided into three sections:

The **Feeder** section tracks the sensors in the feeder section of the printer and notifies the user of the current status.

FEEDER	
Feeder Cover: Closed	Card Present: Present
Pusher Plate: Down	Manual Feed: Active

The **Engine** section tracks the sensors in the main section of the printer and notifies the user of the current status.

ENGINE	
Card Sync: Blocked	Ribbon Color Detect: Yellow
Print Cover: Closed	Printhead Cam: Blocked
Ribbon Takeup: Not Moving	Ribbon Payout: Not Moving

The **Options** section tracks the sensors in the installed options of the printer and notifies the user of the current status.

OPTIONS	
Flipper: Unlocked	

## Calibration

The **Calibration** sub-tab is divided into three sections:

Zebra ZC300 USB Card Printer - Advanced Settings

**PRINT HEAD**

Serial Number: 77-00199 Resistance: 3080 ohms

**SMARTCARD OFFSETS**

Contact: 0 LF Contactless: 0

UHF Contactless: 0 HF Contactless: 0

**CALIBRATION**

Command: Ribbon Calibrate

Restore Defaults Cancel Apply

The **Printhead** section tracks the serial number and resistance value of the currently installed printhead. Use this section when installing a new printhead to enter new values.

**PRINT HEAD**

Serial Number: 77-00199 Resistance: 3080 ohms

The **Smartcard Offsets** sections identifies values for different smartcard types, and enables the user to change the values.

**SMARTCARD OFFSETS**

Contact: 0 LF Contactless: 0

UHF Contactless: 0 HF Contactless: 0

The **Calibration** section enables the user to calibrate certain sensors in the printer. This option can be used if a particular sensor is suspected to not be working properly. Currently, the only sensor available to calibrate is the Ribbon Detect Sensor.

**CALIBRATION**

Command: Ribbon Calibrate

## Advanced Features

**Important** • The Advanced Features tab is password protected and should only be accessed by trained personnel.

When prompted, enter the password to access the Advanced Features.

The Advanced Features tab is divided into two sub-tabs:

- Diagnostics
- Config Request

## Diagnostics

The **Diagnostics** sub-tab window is divided into seven sections:

- Motor
- Cam
- Transport
- Sensor
- Rotate
- Panel
- Fan

### Motor

The **Motor** section enables the user to activate the motors individually. Select the motor, the motor speed (if applicable), and direction from the drop-down lists and click **On**. The motor will engage at the selected settings, click **Off** to disengage the motor.

**WARNING** • Do not engage the card feed motor with cards present in the input hopper or serious damage may result.

**Note** • Each motor can be engaged in either Forward or Reverse.

- The Card Feed motor can be engaged at speeds ranging from 0–2000 in increments of 100.
- The Card X motor can be engaged at speeds of 1–20 in increments of 1.
- The Ribbon motor can be engaged at a single speed only.
- The Head Lift motor can be engaged at speeds of 0–2000 in increments of 100.
- The Options motor can be engaged at speeds of 0–2000 in increments of 100.
- The Flipper motor can be engaged at speeds of 0–2000 in increments of 100.

### Cam

The **Cam** section is used to drive the lift cam for either the options module (if installed), or the printhead to be put into preset positions.

- The Options module can be set to Contact, Mag, or Home.
- The Printhead can be set to position A–E.

## Transport

The screenshot shows a control panel titled "Transport". Below the title is a dropdown menu labeled "Command:" with "Feeder to Card Sync" selected. To the right of the dropdown is a blue button labeled "Run".

Transport	
Command:	Feeder to Card Sync
<button>Run</button>	

The **Transport** section sends cards to different locations in the printer.

- Feeder to Card Sync
- Card Sync to Options
- Engine to Flipper Hold
- Engine to Flipper Flip
- Engine to Flipper Eject
- Engine to Flipper Reject
- Flipper to Reject
- Flipper to Engine
- Options to Card Sync
- Engine to Exit

## Sensor

The screenshot shows a control panel titled "Sensor". Below the title is a dropdown menu labeled "Sensor:" with "Card Out" selected. Below the dropdown are two buttons: a grey "On" button and a blue "Off" button.

Sensor	
Sensor:	Card Out
<button>On</button> <button>Off</button>	

The **Sensor** section enables the user to turn different sensors on or off.

- Card Out
- Lid
- Printer Lock
- Card Feed

## Rotate

The screenshot shows a control panel titled "Rotate". Below the title is a dropdown menu labeled "Position:" with "Accept" selected. To the right of the dropdown is a blue button labeled "Rotate".

Rotate	
Position:	Accept
<button>Rotate</button>	

The **Rotate** section is used to move the flipper (if installed) to different positions.

- Accept
- Eject
- Reject
- Flipper Init
- Flipper Rotate to Home

## Panel

The Panel configuration interface consists of a title bar labeled 'Panel'. Below the title bar, there is a label 'Panel:' followed by a drop-down menu currently showing 'Yellow'. To the right of the drop-down menu is a blue button labeled 'Move'.

The **Panel** section is used to move the specified ribbon panel into the ready position. The drop-down menu contents will vary depending on the ribbon installed.

## Fan

The Fan configuration interface consists of a title bar labeled 'Fan'. Below the title bar, there is a label 'Fan:' followed by a drop-down menu currently showing 'Printhead'. To the right of the drop-down menu are two buttons: a blue 'On' button and a grey 'Off' button.

The **Fan** section turns the cooling fan(s) on or off. Currently, only the printhead fan is supported.

## Config Request

The **Config Request** section is divided into two sections:

The Advanced Configuration Request interface is divided into two main sections. The top section, titled 'COMMAND REQUEST', contains a 'Select Field:' label followed by a drop-down menu showing 'cancel printer passkey' and a blue 'Save Request' button. The bottom section, titled 'RESPONSE', contains a 'Set New Value Of:' label followed by a text input field, a blue 'Load Response' button, and a grey 'Set New Value' button.

The **Command Request** section is used to generate a secure request to change certain parameters of the printer. The user then sends this request to Zebra Technical Support.

**Important** • The request generated is specific to the printer and cannot be used on other printers.

The **Response** section is used to load the Zebra generated response for that specific printer.

## Help and Support

See [“Help & Support Tab”](#) on page 8.

The CLEANING interface has a title bar labeled 'CLEANING'. Below the title bar, there is a section titled 'Images Remaining Until Next Cleaning:' which includes a green progress bar and the text '1000 out of 1000'. To the right of this section is a blue 'Clean Now' button. Below the progress bar, there is a 'Clean Printer Error Mode:' label followed by a drop-down menu showing 'Stop Printing'. To the right of this, there is a 'Cleaning Interval:' label followed by a text input field showing '5000'. Below the interval field, there is a 'Pre-Cleaning Count:' label followed by a text input field showing '20'.

The Cleaning section in the Help and Support tab of the Advanced Settings utility has several additional setting to configure printer cleaning:

The **Clean Printer Error Mode** setting tells the printer to either Stop Printing when the cleaning notification occurs, or to Allow Printing (default). If the user sets the error mode to Stop Printing, cleaning must be done before any printing can continue. If the user sets the error mode to Allow Printing, printing can continue and cleaning can be done at a later time.

The **Cleaning Interval** determines how many cards can be printed before cleaning is required; the recommended (and default) value is 1,000 cards, and the maximum cleaning interval is 5,000 cards.

**Important** • Zebra does not recommend continued printing past the default cleaning interval as dust and debris will collect on the print surfaces and result in poor print quality.

The **Pre-Cleaning Count** displays a warning in the driver control panel and the printer display (ZC100 not applicable) showing the number of cards remaining before cleaning is due. The default value is twenty (20).

# Printer Properties

To open the Printing Preferences Control Panel:

- Windows 7 – Select Start, then click **Devices and Printers**. Right click the Zebra ZCXXX Card Printer, and select **Printer properties** from the pop-up menu.
- Windows 8 – Press Windows + I and select **Control Panel** from the pop-up menu. Select **Hardware and Sound**, then select **Devices and Printers**. Right click the Zebra ZCXXX Card Printer, and select **Printer properties** from the pop-up menu.
- Windows 10 – Press Windows + I and select **Devices**, then select **Printers and Scanners**. Select the Zebra ZCXXX Card Printer and click **Manage**, and then select **Printer Properties**.

## Sharing

On the Sharing tab (Sharing Property Page), you can choose to share the printer over the network and install additional drivers to accommodate different operating systems.

To share a printer, select **Share this printer**; and specify a name in the Share name field for the shared resource.

To change the shared name, simply enter a new name in the Share name field.

To quit sharing a printer, deselect **Share this printer**.

Render print job on client side check-box – This setting should be disabled if the host operating system is Windows Vista, Windows 7, Windows Server 2008, Windows Server 2008 R2, Windows 8, or Windows Server 2012.

Click on the **Additional Drivers** button if this printer is shared with users running different versions of Windows. Additional drivers can then be installed so that the users do not have to find the print driver when they connect to the shared printer.

## Color Management

The optimal color profile is automatically selected when the card type is selected.

Color Management settings allow you to associate color profiles on the printer based on the type of media being used and printer configuration.

When you click on the Color Management button, you will see the following three tabs:

- Devices
- All Profiles
- Advanced

For details on color management, click on the Understanding color management settings link on the Color Management Devices tab.
